

Smart Contract Developer

About Qiro

Qiro is building the infrastructure for **tokenized private credit** and **on-chain underwriting**. Our mission is to make private credit **transparent, efficient, and globally accessible** — bridging traditional finance with decentralized technology.

We design products that power **institutional-grade credit markets on-chain**, combining tokenized credit structures, secure smart contracts, and compliant DeFi rails.

Every day, our team works across **finance, blockchain engineering, and product** to build systems that move real capital safely and reliably.

About the Role

As a **Smart Contract Developer** at Qiro, you'll design and build the **core on-chain protocols** that power our private credit infrastructure. You'll work closely with backend engineers, product teams, and auditors to develop secure, production-grade smart contracts that manage capital, enforce credit logic, and integrate seamlessly with the rest of the platform.

This is a **full-time, in-office IC role** where you'll own end-to-end smart contract development and be part of Qiro's **core engineering team**, working directly with founders and technical leadership.

What You'll Do

- Design, implement, and deploy **secure, auditable smart contracts** using **Solidity** on Ethereum or other EVM-compatible chains.
- Build contracts that meet **institutional-grade security and audit requirements**.
- Write clean, readable, gas-efficient Solidity code backed by comprehensive test coverage.
- Collaborate closely with **backend engineers, product teams, and security auditors** to identify risks and enforce best practices.
- Produce clear and well-structured **technical documentation** for smart contract systems and workflows.
- Participate in architecture reviews, code reviews, and audit remediation processes.
- Stay current with **Solidity/EVM updates**, tooling improvements, and emerging exploit vectors.
-

Who You Are

- **4–5 years** of professional software engineering experience, with **strong hands-on experience in Solidity and EVM-based smart contracts**.
- Proven experience deploying **production-grade, non-trivial smart contracts**, ideally with completed security audits.
- Deep understanding of **blockchain fundamentals**, common smart contract vulnerabilities, and EVM mechanics.
- Hands-on experience with modern smart contract tooling such as **Hardhat or Foundry**.
- Strong testing discipline and experience writing **comprehensive smart contract test suites**.
- Ability to design **clean, intuitive smart contract interfaces**.
- Clear communicator who values direct feedback and cross-functional collaboration.
-

Why Join Qiro

- Build the **on-chain foundation** for next-generation private credit markets.
- Work directly with **founders, backend engineers, and auditors** on mission-critical systems.
- **Work from office only** — we believe deep collaboration is essential for secure protocol development.
- Competitive compensation (cash + ESOPs)
- Location: **Bangalore**

Our Culture

We care deeply about **correctness, security, and long-term thinking**.

Everyone at Qiro is part of the core — we design systems that must hold up under real-world stress and real capital.

If you enjoy building

serious smart contracts

, care about protocol security, and want to help shape the future of tokenized private credit — you'll fit right in.
